DISTINCTIVE METALS COLLECTION

The Distinctive Metals Collection paintings are premium and more complex than standard liquid paintings. Contrary to normal liquid painting with uniform color and a smooth surface, special paintings may have varied shades of color, a textured surface, and aesthetic effects that can imitate other materials such as copper, bronze, iron, concrete, etc.

Distinctive Metals Collection finishes are obtained through a complex process which results from the combination of two or more of the following treatments:

- Application of different liquid paint layers on top of each other;
- Mechanical treatments of the surface (rubbing, sanding, etc);
- Chemical treatment of the surface.

Some of these processes are done by hand by expert artisans using simple tools, while others are obtained through high-tech machines. Each special painting is the result of a long-studied process which has led to unique exquisite finishes. Distinctive Metals Collection finishes are available both in Standard or CSM for badly polluted areas and/or coastal environments.

Brombal "Distinctive Metals Collection" is a hand applied specialty finish. Variation in color and pattern can differ from one unit to another while maintaining an overall tonality as approved in the sample. Please ask your Brombal representative should you have any questions or concerns.
